

SPINNING REEL HAVING COVER FOR DECORATION

BACKGROUND OF THE INVENTION

1. Field of the Invention

5 The present invention relates generally to a fishing tool, and more particularly to a spinning reel, which has a cover mounted thereon for decoration and for masking the exposed bolts.

2. Description of the Related Art

 A conventional spinning reel has a reel body, a drive mechanism mounted
10 inside the reel body, a handle to drive the drive mechanism working, a rotor rotatably mounted on the reel body and driven by the drive mechanism for rotation, and a spool reciprocally mounted on the reel body and driven by the drive mechanism for reciprocation. The drive mechanism is fixedly mounted in the reel body by bolts and the reel body consists of two cases coupled with each other by bolts too, so that the
15 spinning reel has many heads of the bolts exposed outside. The conventional spinning reel was provided with a cover mounted on the reel body for masking the exposed heads of the bolts. However, the cover is mounted on the reel body by bolts too, so that there are still heads of bolts exposed.

20 SUMMARY OF THE INVENTION

 The primary objective of the present invention is to provide a spinning reel having a cover, which has a smooth surface and without bolt exposed.

 According to the objective of the present invention, a spinning reel comprises a reel body having a connection portion for connecting said reel body to a
25 fishing rod, and an engagement portion. A handle is rotatably mounted on the reel body.

A rotor has a hole fitted onto the engagement portion of the reel body to mask the engagement portion. A spool is rotatably mounted on the reel body for a fishing line wound thereon. A cover is mounted on the reel body to mask a portion of the reel body. The cover has two arms each of which have a distal end coupled to the engagement
5 portion.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a front view of a first preferred embodiment of the present invention;

10 FIG. 2 is a perspective view in part of the first preferred embodiment of the present invention;

FIG. 3 is an exploded view of FIG. 2;

FIG. 4 is a front view in part of a second preferred embodiment of the present invention;

15 FIG. 5 is an exploded view of FIG. 4;

FIG. 6 is a front view in part of a third preferred embodiment of the present invention, and

FIG. 7 is an exploded view of FIG. 6.

20 DETAILED DESCRIPTION OF THE INVENTION

As shown in FIGS. 1-3, a spinning reel 10 of the first preferred embodiment of the present invention mainly comprises a reel body 20, a handle 40 rotatably mounted on the reel body 20, a rotor 42 provided on the reel body 20 to be driven by the handle 30 for rotation, a spool 46 provided on the reel body 20 to be driven by the
25 handle 30 for reciprocation, and a cover 50.

The reel body 20 has a connection portion 22, an engagement portion 24 and a lowland portion 28. The connection portion 22 is a T-shaped post to be coupled with a fishing rod 12. The lowland portion 28 is arranged at a rear of the reel body 20 and has a shape that is complementary to the cover 50. The engagement portion 24 is a short column at a front of the reel body 20 having two thread holes 26 on a periphery thereof. Bolts 29 are screwed on the lowland portion 28 to fix a drive mechanism (not shown) and the other parts of the spinning reel 10 in the reel body 20.

The handle 40 is rotatably mounted on the reel body 20 to drive the drive mechanism working. The rotor 42 has a hole 44 to be coupled with the engagement portion 24 of the reel body 20 such that the engagement portion 24 is masked by the rotor 42. The rotor 42 is driven by the drive mechanism for rotation. The spool 46 is provided on the reel body 20 for a fishing line 48 wound thereon. The spool 46 is driven by the drive mechanism for reciprocation.

The cover 50 is covered on the lowland portion 28 of the reel body 20, and the surface of the cover 50 is flush with the surface of the reel body. The cover 50 has two parallel arms 52 on each of which have an opening 54 adjacent to a distal end thereof. The arms 52 is arranged in between the engagement portion 24 and the rotor 42 and two bolts 56 are inserted into the openings 54 of the arms 52 and screwed into the thread holes 26 of the engagement portion 24.

After the cover 50 is mounted, it masks all of the exposed heads of the bolts 29 on the reel body 20 and the bolts 56 fixed the cover 50 are masked by the rotor 42 so that the spinning reel 10 of the present invention is seen no bolt on the surface thereof. The cover 50 is provided with various holes 50 for decoration.

As shown in FIG. 4 and FIG. 5, the second preferred embodiment of the present invention provides a spinning reel 60 having a reel body 62 on which has an

engagement portion 64 and two holes 66 on the engagement portion 64. A cover 68 has two arms 70 on each of which has a hooking portion 72. The cover 68 is mounted on the reel body 62 with the hooking portions 72 hooking the holes 66 and the hooking portions 72 of the cover 68 are masked by the rotor (not shown) as the first preferred embodiment do.

In fact, what way of the cover mounted on the reel body is not the main scope of the present invention. The main scope of the present invention is to provide the cover having a portion coupled with the engagement portion of the reel body and masked by the rotor.

FIG. 6 and FIG. 7 show a spinning reel 80 of the third preferred embodiment of the present invention. The spinning reel 80 has a reel body 82 provided two holes 84, and a cover 86 having two hooking portions 88 on two arms thereof. The cover 86 is mounted on the reel body 82 with the hooking portions 88 engaging the holes 84. The cover masks the bolts mounted on the reel body.
